

# CTCOpc Server Installation As Service & Remote Access

**Note:** Below Assumes CTCOpc server is installed, licensed and operational locally before proceeding. The desired project should be the last loaded as that will be the one the service will start with. The service will have to be restarted whenever a change occurs to the project file (.cop).

## Windows 7/10

Disable User Access Control (UAL) and reboot. This is under Control Panel->User Accounts

## Windows 7/10 & Windows XP Service Pack 3

1. Create a C:\CTCOpc directory. Unzip the CTCOpcServices.zip file to this directory. It contains the utility programs and dll's needed for running CTCOpc as a service. The batch file you will run in the next step will only run properly with this exact directory name and placement.
2. Copy and paste the dll files within this directory (logger.dll and srvstart.dll) to the Windows\System32 subdirectory. Make sure msvcrt.dll is present in the directory

and if not obtain from Microsoft or another Windows installation. This dll may be missing on Windows XP but has always been present thus far on Windows 7/10.

3. Open a command window as administrator (right click and select 'run as administrator' on the cmd selection). Execute the batch file: installSVC\_CTCOPC for a 32 bit operating system or installSVC\_CTCOPC64 for 64 bit, and ensure SUCCESS status as shown below:

```
C:\>cd CTC0pc
C:\CTC0pc>dir
Volume in drive C has no label.
Volume Serial Number is CC87-7B06

Directory of C:\CTC0pc

03/27/2012  09:26 AM    <DIR>          .
03/27/2012  09:26 AM    <DIR>          ..
03/26/2012  11:53 AM             216 CTC0pc.ini
03/27/2012  09:29 AM             159 installSUC_CTCOPC.bat
09/27/2000  11:02 AM            28,672 logger.dll
09/27/2000  11:02 AM           143,360 srvcstart.dll
09/27/2000  11:02 AM           36,864 srvcstart.exe
09/27/2000  11:02 AM           116,224 svc.exe
             6 File(s)              325,495 bytes
             2 Dir(s)  148,481,720,320 bytes free

C:\CTC0pc>installSUC_CTCOPC

C:\CTC0pc>sc create CTC0pc DisplayName= "CTC0pc" binPath= "c:\CTC0pc
[SC] CreateService SUCCESS

C:\CTC0pc>sc description CTC0pc "CTC OPC Server"
[SC] ChangeServiceConfig2 SUCCESS
C:\CTC0pc>
```

Note: Documentation for the batch file can be obtained from:

<http://www.nick.rozanski.org.uk/services>

<http://www.howtogeek.com/50786/using-srvstart-to-run-any-application-as-a-windows-service/>

Reboot the computer or start the service as shown below (Control Panel->Administrative Tools):

## Windows XP:

The screenshot shows the Windows XP Services console. The title bar reads "Services (Local)". The main window displays a list of services for the local computer. The service "CTCOpc" is selected and highlighted in blue. Its status is "Started" and its startup type is "Automatic".

Local access only is now enabled.

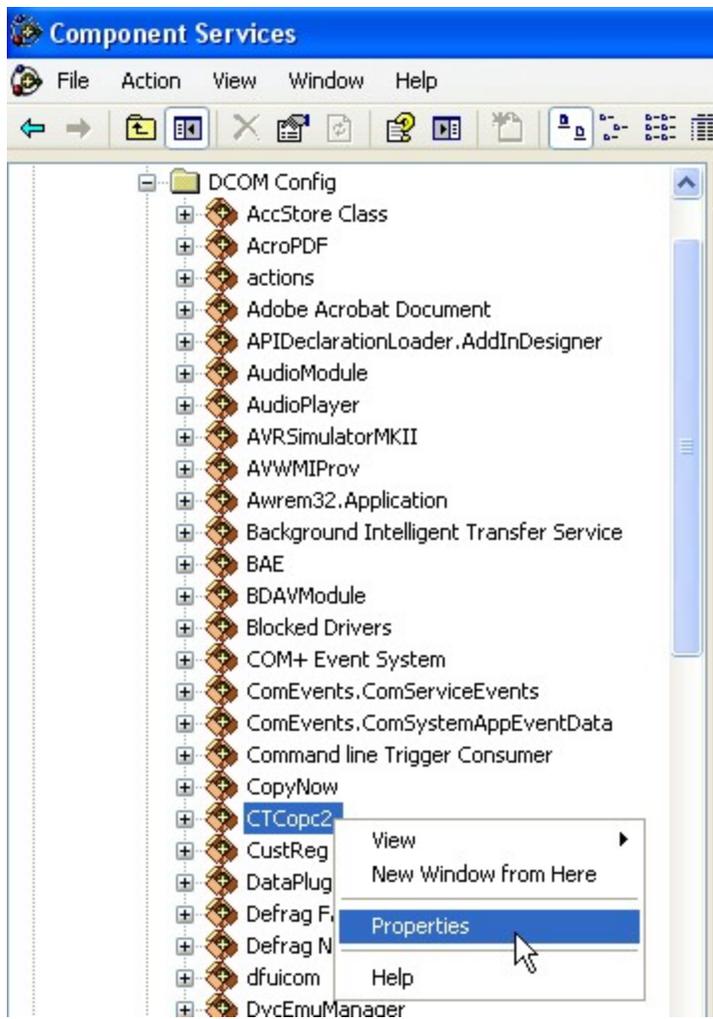

# Windows XP - Remote Access of CTCOpC Server

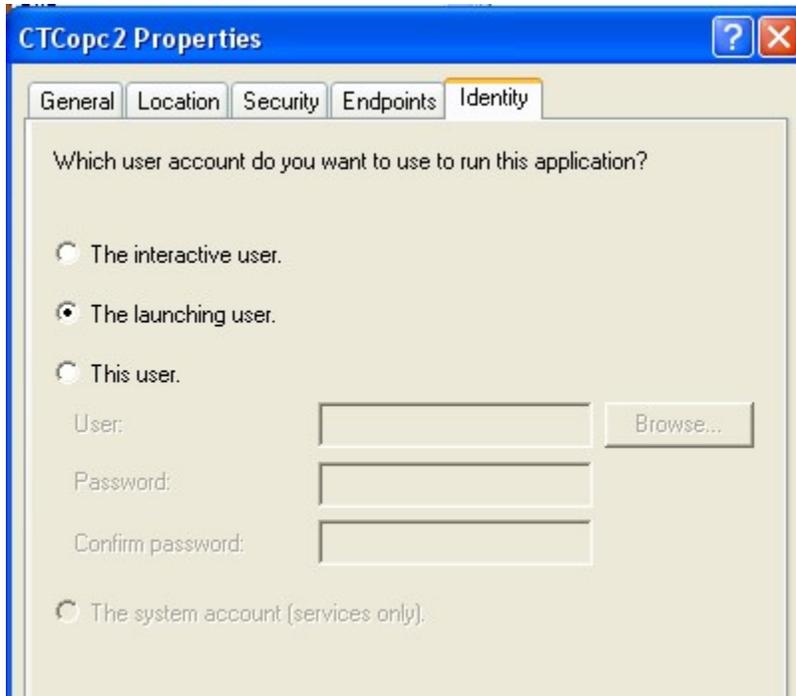

For Remote Access COM Security must be modified:

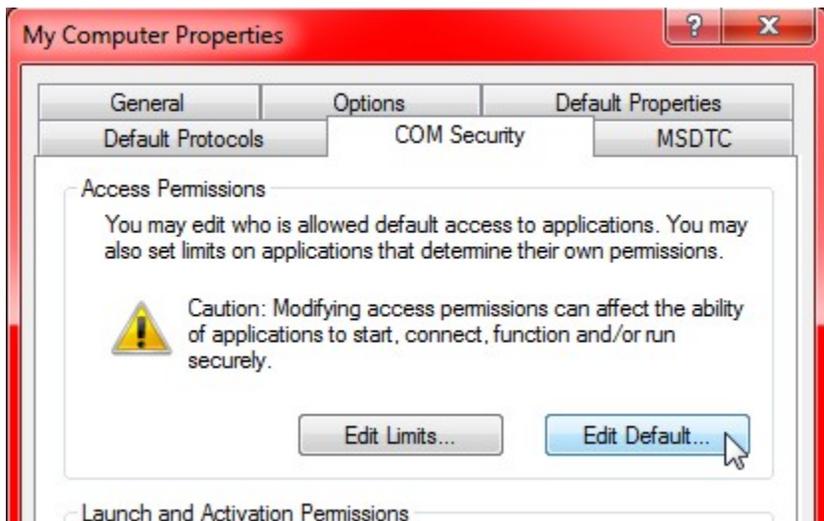

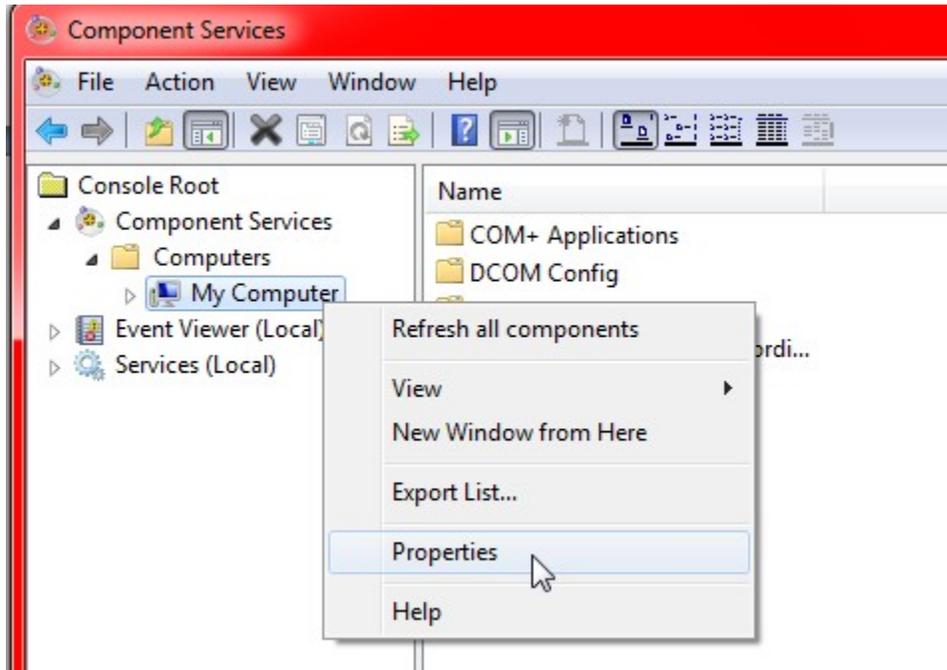

For remote access it may be preferred to select 'This user' and define an account to be used exclusively by OPC.

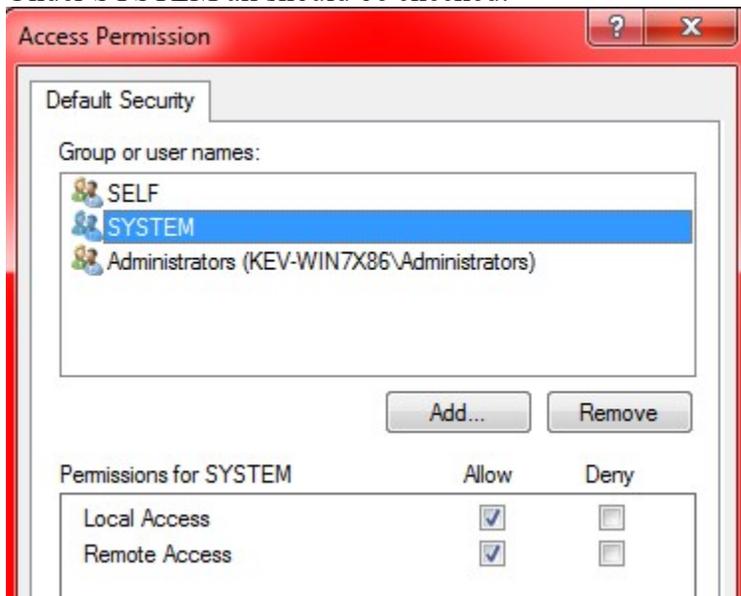

Note that above assumes Windows Firewall is disabled, if it must be turned on reference that section in Windows 7 for additional requirements, Page 14.

## Windows 7 - Remote Access of CTCOpC Server

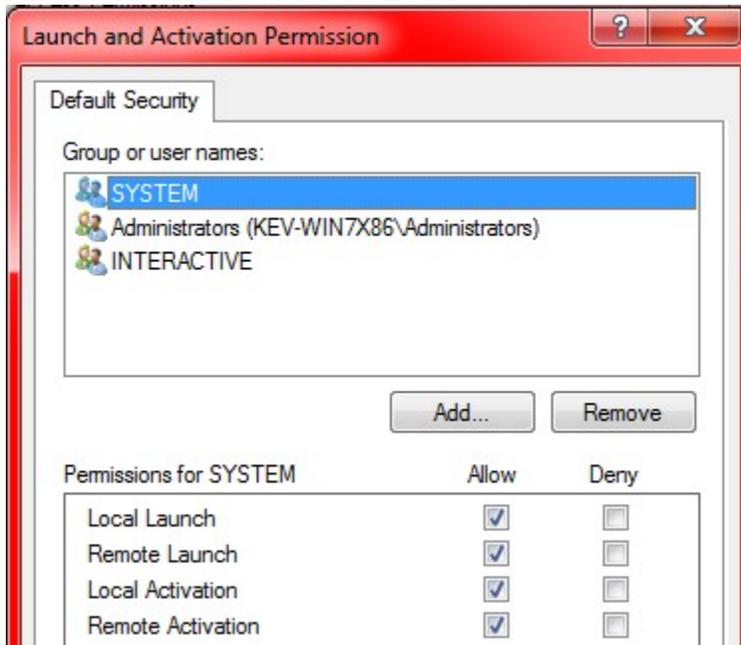

For Remote Access COM Security must be modified. Access this from the Control Panel->System and Security->Administrative Tools->Component Services Screen:

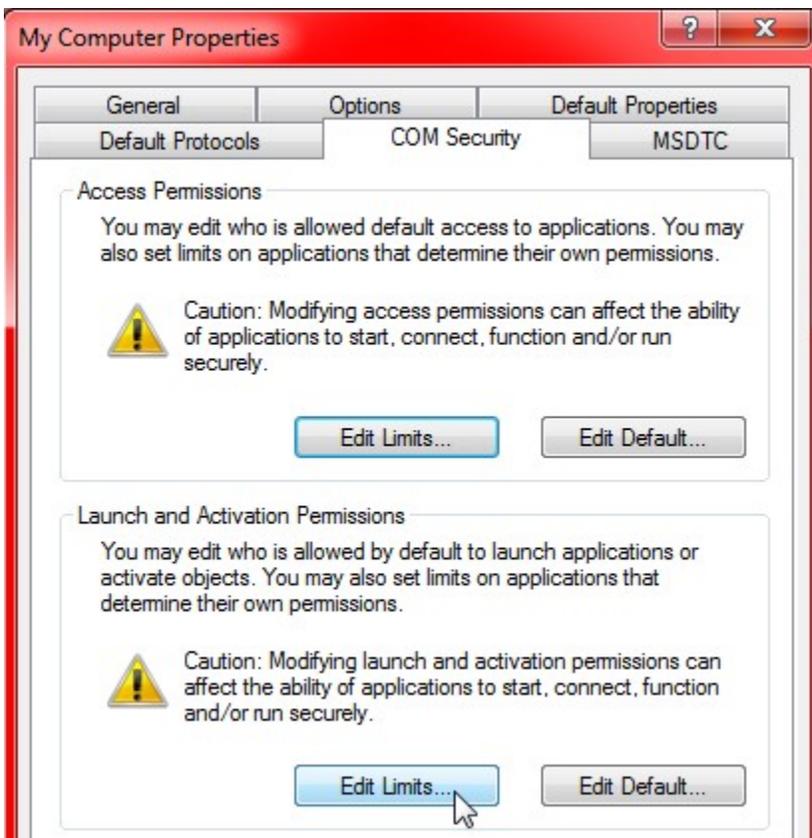

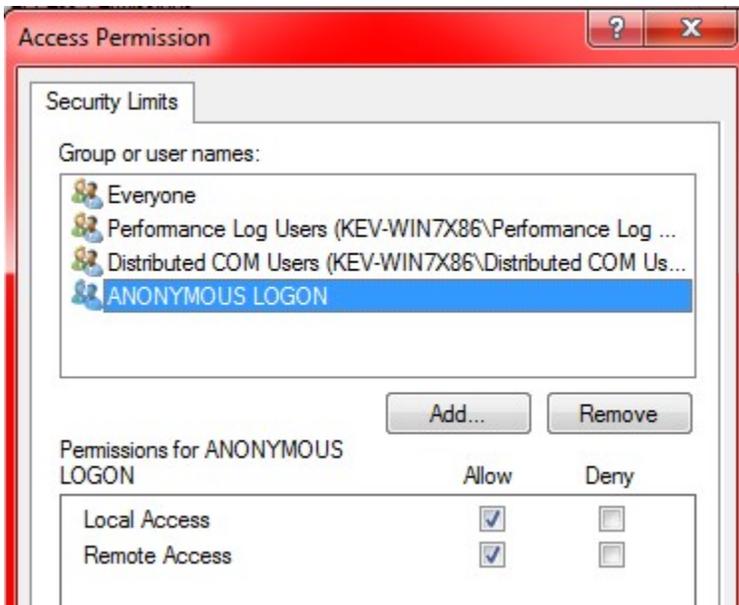

Under SYSTEM all should be checked:

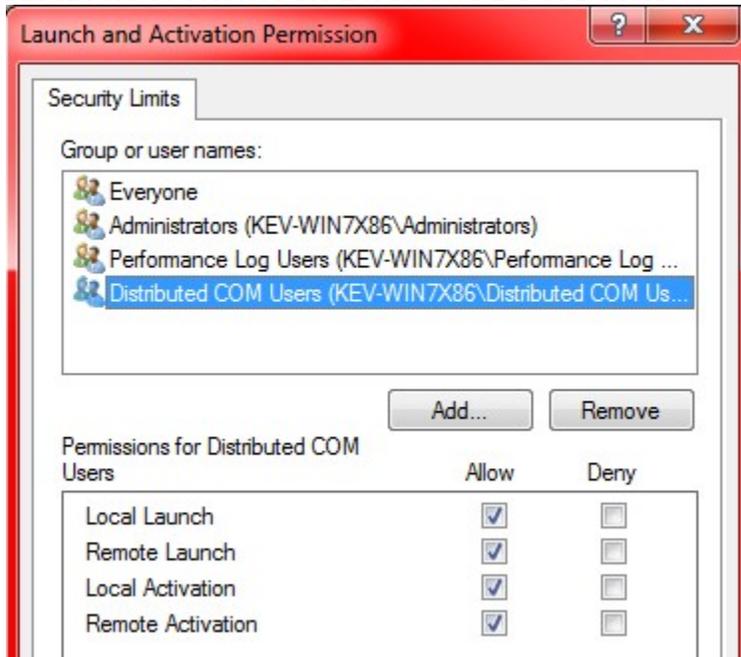

All should be selected for each below:

All should be checked for each below:

All should be selected for Distributed DCOM Users:

Below from following web site:  
<http://www.aggsoft.com/asdl-dcom-opc-config-3.htm>

### 3.1 PERMITTING DCOM ACTIVITY

By default, Windows blocks inbound connections from other computer. For OPC clients to be able to connect to OPC servers on this computer, enable the corresponding rule.

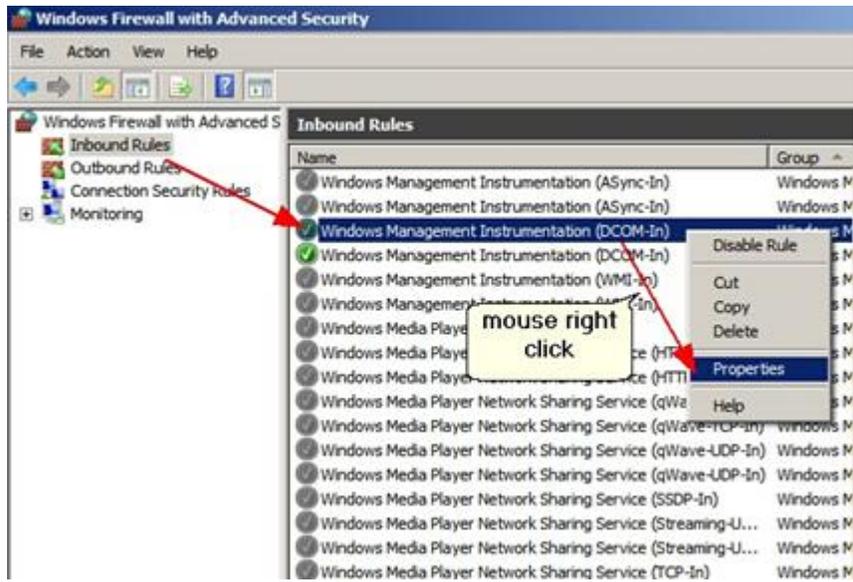

Fig. 12 Firewall rule properties

Fig. 13 Permitting DCOM activity

**For Windows 7 users.** If the "COM+ network access" or "DCOM" rule is not in the list, create two "Port" rules.

1. Port 135 rule for the TCP protocol;
2. Port 135 rule for the UDP protocol;

### 3.2 CREATING RULES FOR EVERY OPC SERVER

You need to permit activity for every OPC server running on this computer. Also, you should permit network activity for the OpcEnum system service that allows remote clients to receive the list of servers from this computer.

Below you can see an example of how to create a rule for OpcEnum. Rules for other applications are created in a similar way.

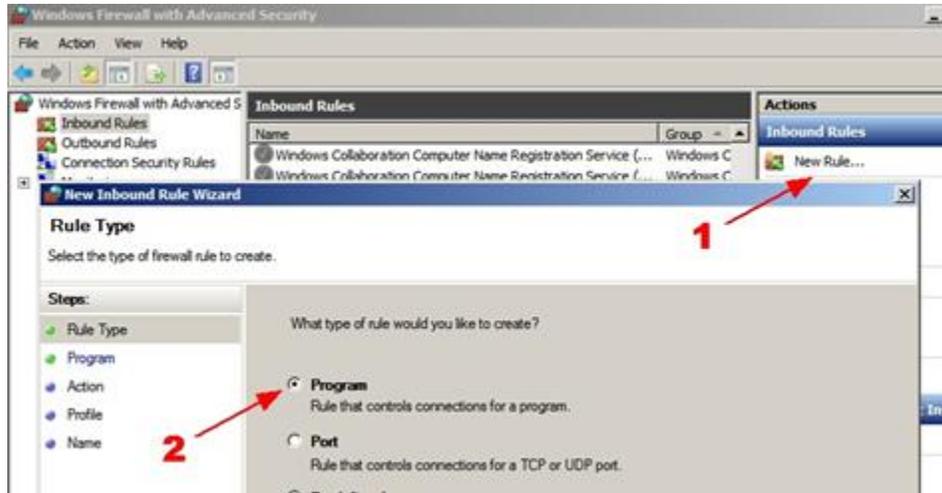

Fig. 14 Adding an individual rule

1. Select the "New Rule" action;
2. Select the "Program" rule type;
3. Click the "Next" button.

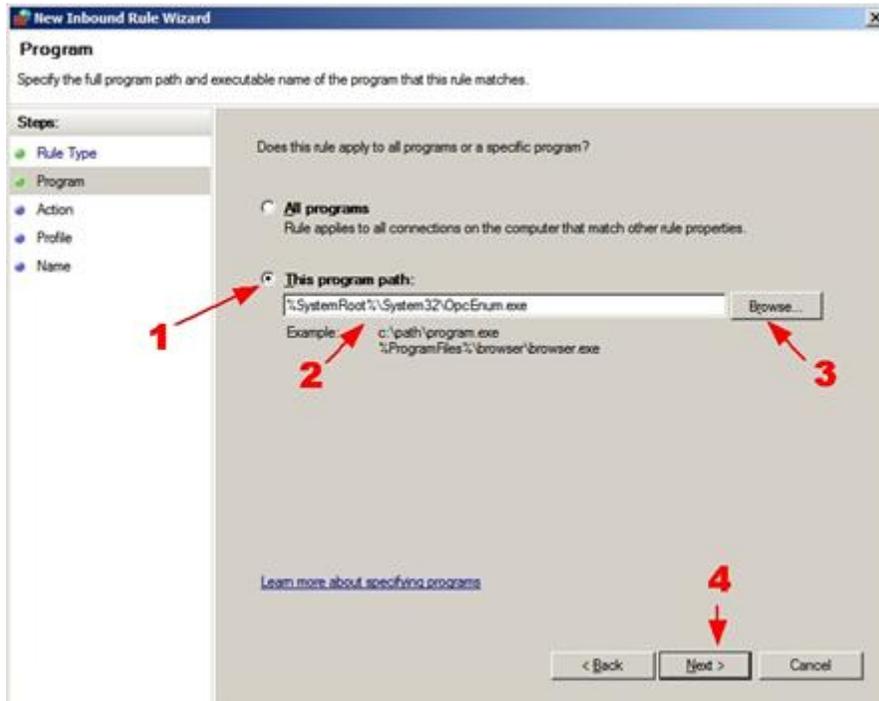

Fig. 15 Selecting the file

1. Select the "Program Path" option;
2. Specify the full path to the program and its file name;
3. You can select the program on the disk using the "Browse" button;
4. Click the "Next" button.

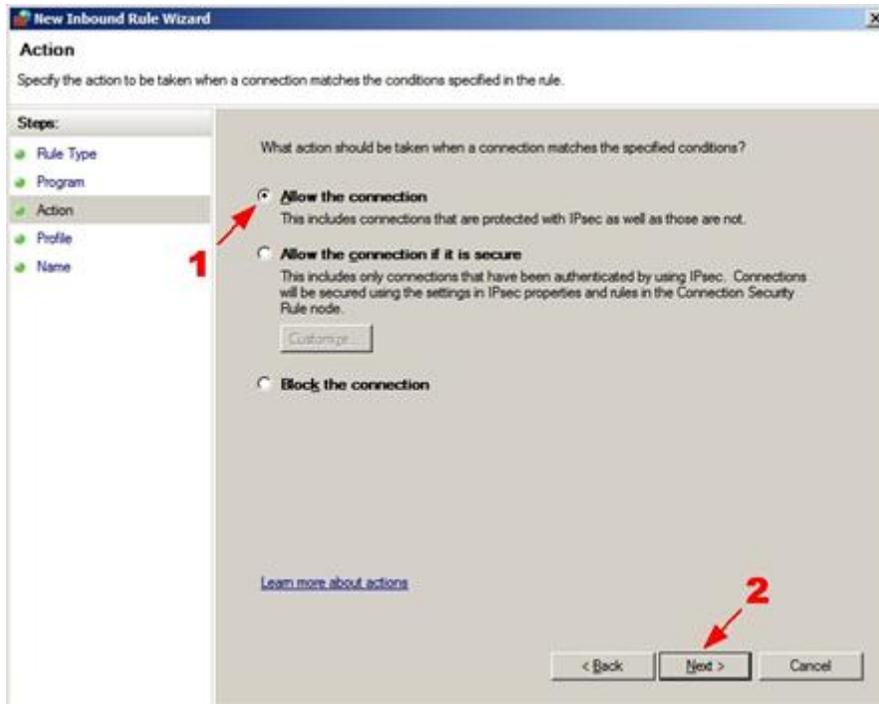

Fig. 16 Rule properties

Fig. 17 Active profiles

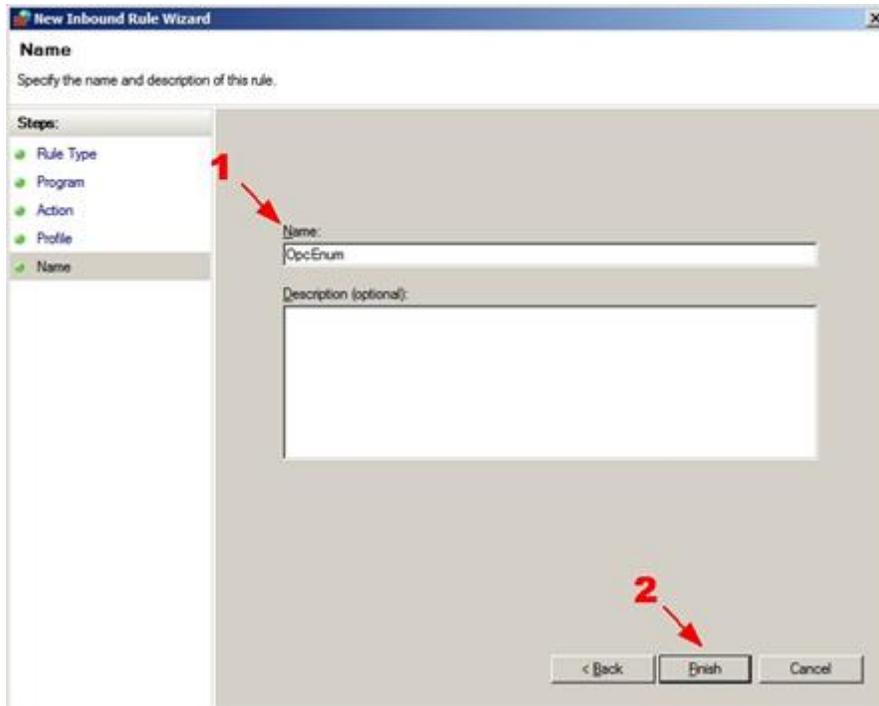

Fig. 18 Rule name

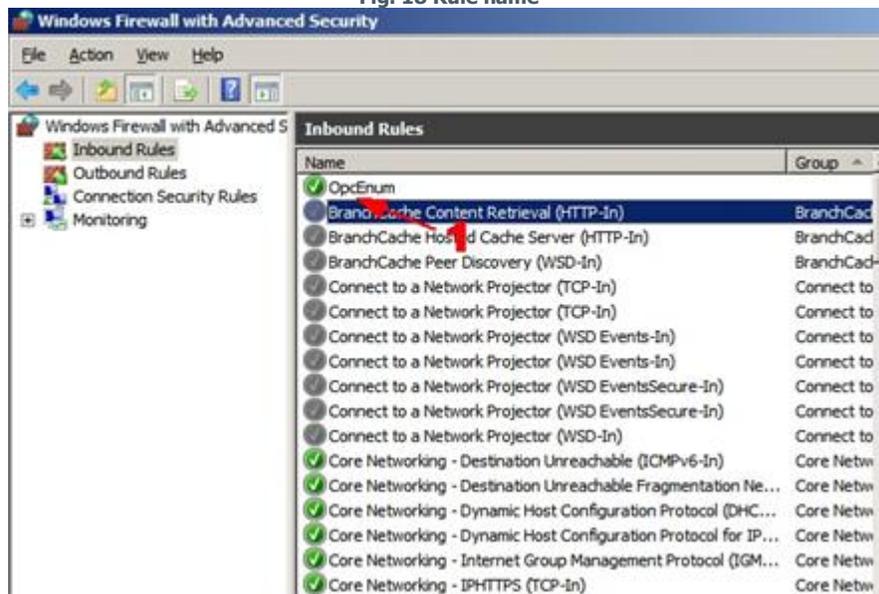

Fig. 19 Active rules

Note: Add CTCOp.exe to the Windows Fire Wall exception screen.

## DCOM Configuration:
